

Enabling additional audio gain to MD-100 Mike

Author: Keith Beckmann - K9GL

There is a hidden feature of the MD-100 Mike that when you enable the Filter mode (Main switch in FLT) you can increase the audio.

Remove the 4 screws holding the plat to the bottom of the mike, and locate the 2 square pads. Jumper these 2 pads to increase the audio. You can also make this adjustable by installing a 10K pot instead of a jumper.

NOTE: This will only work in the FLT mode, and only if you are supplying +5V DC to the Mike. Most mike connectors on newer rigs DO supply this voltage.
